

# DotNet Society Hour-of-Code

# Build-a-Bot Workshop 2: JavaScript & Node.js

# Hello!

## I am Martius

I am here because I love to share about cool new technologies 😊

You can find me at @martiuslim on Telegram or GitHub

Join our Microsoft Student Community Telegram chat  
@ <http://tinyurl.com/smudotnet>

These slides can be found @  
<https://github.com/martiuslim/build-a-bot>

# Hour-of-Code: Build-a-Bot

- ◇ Understanding Chatbots
- ◇ **> JavaScript & Node.js <**
- ◇ Microsoft Bot Framework
- ◇ Git
- ◇ Azure

# JavaScript & Node.js

- ◇ Software Prerequisites
- ◇ JavaScript
- ◇ Node.js
- ◇ Building a server using Express.js

A decorative pattern of hexagons in various shades of blue and cyan. Some hexagons contain icons: a lightbulb, a thumbs up, a network of nodes, a smartphone, a magnifying glass, a gear, and a speech bubble. A large cyan hexagon in the center contains the number '2'.

2

# Software Prerequisites

Getting started

# Visual Studio Code

- ◇ <https://code.visualstudio.com/>
- ◇ Visit the extensions tab (**ctrl + shift + x**) and download the **Code Runner** extension by Jun Han
- ◇ This allows you to run code in your VSCode terminal using the command **ctrl + alt + n**

# Homebrew (Mac users only)

◇ <https://brew.sh/>

# Node.js

- ◇ <https://nodejs.org/en/>
- ◇ Downloading the LTS version is enough
- ◇ For Mac users that installed Homebrew, you can install node using '**brew install node**'
- ◇ Check your installation using '**node -v**'

# npm

## (Node Package Manager)

- ◇ <https://docs.npmjs.com/getting-started/installing-node>
- ◇ It should come installed with Node.js
- ◇ Check your installation using '**npm -v**'
- ◇ Update your npm using '**npm install npm@latest -g**'

A decorative pattern of hexagons in various shades of blue and cyan on the left side of the slide. Some hexagons contain icons: a lightbulb, a thumbs up, a network node, a smartphone, a magnifying glass, a gear, and a speech bubble.

2

# JavaScript

A technical introduction

# JavaScript (ECMAScript 6)

- ◇ Lightweight interpreted programming language
- ◇ Multi-paradigm scripting language
- ◇ Usually runs on the client side of the web
- ◇ <https://developer.mozilla.org/en-US/docs/Web/JavaScript>

# Types

- ◇ **String** – 'hello world', 'building a bot!'
- ◇ **Number** – 7, 12.34
- ◇ **Booleans** – true, false
- ◇ **Null** – represents 'no value'
- ◇ **Undefined** – represents an undeclared value

# console.log()

- ◇ Prints data to the console (your cmd/ powershell/ terminal window)
- ◇ Quick and useful tool for debugging
- ◇ Use it often when developing!

# Operators

- ◇ Built-in operators – + - / \*
- ◇ Compute numerical operations on numbers
- ◇ There are also += -= /= and \*=
- ◇ This means to perform the mathematical operation on the left using the number on the right, then assign the new value to the variable.

# Properties & Methods

- ◇ JavaScript associates certain properties with different data types
- ◇ Built-in methods for different data types such as **.length**

# Libraries

- ◇ Collection of functions or methods
- ◇ Useful abstractions of code that others have written so that you don't have to write your own
- ◇ If there's a function you're looking for, chances are someone out there has already written it

# Comments

- ◇ Write single-line comments with `//` and multi-line comments with `/* */`
- ◇ Use comments to document and explain your code

# Variables

- ◇ Holds reusable data
- ◇ JavaScript traditionally used **var**
- ◇ ES6 introduced **const** and **let**
- ◇ Use **const** when you don't need to reassign the value and **let** when you need to.

# String Interpolation

- ◇ Insert variables into your Strings
- ◇ ES6: Use **backticks** and **`${variableName}`**
- ◇ Backtick is the key above your Tab key and beside the number 1

# Control Flow

- ◇ Statements that allow JavaScript programs to make **decisions** by executing code based on **conditions**

# If/ else and else if

```
◇ if (condition) {  
    // do something if condition is true  
} else if (anotherCondition) {  
    // do something else if anotherCondition is true  
} else {  
    // if all else fails do this  
}
```

# Truthy vs Falsy

- ◇ All conditions are evaluated to be **truthy** or **falsey**
- ◇ JavaScript can evaluate conditions on more than just 'true' or 'false'
- ◇ E.g. a non-empty String evaluates to be **truthy**, undefined or null evaluates to be **falsey**

# Switch statements

◇ Another way of writing if/ else if/ else

◇ `switch(condition) {`

`case (condition):`

`// do something`

`case (anotherCondition):`

`// do something else`

`}`

# Ternary Operator ?

- ◇ Allows us to refactor simple if/ else statements
- ◇ (condition) ? (result if condition is true) : (result if condition is false)
- ◇ `let hungry = (hungerLevel > 5) ? 'Yes' : 'No'`

# Comparison Operators

- ◇ Less than  $>$  or more than  $<$
- ◇ Correspondingly  $>=$  and  $<=$  for less than equals and more than equals respectively
- ◇ Comparing the two values evaluates to true or false

# Logical Operators

- ◇ `===` for strict equality
- ◇ Use `!` to reverse the truthiness or falsiness
- ◇ We may want to evaluate several conditions
- ◇ To say 'both must be true' we use `&&`
- ◇ To say 'either can be true' we use `||`

# Assignment Operator

- ◇ = is used for assignment
- ◇ let myValue = 10
- ◇ Don't confuse it with the equality operator  
=== or !==

# Functions

- ◇ Written to perform a task
- ◇ Take in data, perform a set of tasks on the data, then return a result

# Functions

- ◇ Define **parameters** to be used when calling the function
- ◇ Pass in **arguments** when calling the function to set its parameters
- ◇ Use **return** to return the result of a function

# Scope

- ◇ The idea in programming that some variables are accessible or inaccessible from other parts of the program
- ◇ **Global Scope** refers to variables that are accessible to every part of the program
- ◇ **Block Scope** refers to variables that are only accessible within the block they are defined

# Arrays

- ◇ Arrays are lists and a way to store data in JavaScript
- ◇ Created with brackets [ ]
- ◇ Index starts from 0, not 1
- ◇ Access items using the index such as `myArray[0]`
- ◇ Has `.length` property to let you see the size of the array

# Arrays

- ◇ Has its own methods such as `.push()` and `.pop()` which adds and removes items from the array respectively
- ◇ You can create an array of arrays!
- ◇ `let countries = [['SG', 'MY'], ['US', 'CA']];`

# Loops

- ◇ Write less repetitive code using loops
- ◇ **for** loops allow you to repeat a block of code for a known amount of times
- ◇ **while** loops are for repeating a block of code for an unknown amount of times
- ◇ **Infinite loops** occur when stop conditions are never met

# Iterators

- ◇ **.forEach()** – used to execute code on every element in an array, but does not change the array and **returns undefined**

# Iterators

- ◇ **.map()** – executes the same code on every element in an array, but does not change the array and **returns a new array with the updated elements**

# Iterators

- ◇ **.filter()** – checks every element in an array to see if it meets certain criteria and **returns a new array with the elements that return truthy for the criteria**

# Objects

- ◇ **Objects** store **key-value pairs** and let us represent real-world things in JavaScript
- ◇ **Properties** in objects are separated by commas, **key-value pairs** are always separated by colons

# Objects

- ◇ You can add or edit a property within an object with **dot notation**
- ◇ The **this** keyword helps us scope inside of object methods. **this** is a dynamic variable that can change depending on the object calling the method

A decorative pattern of hexagons in various shades of blue and cyan. Some hexagons contain icons: a lightbulb, a thumbs up, a network of nodes, a smartphone, a magnifying glass, a gear, and a speech bubble. The number '3' is prominently displayed in a large cyan hexagon.

3

# Node.js

A JavaScript runtime for server-side implementations

# What is Node.js

- ◇ Non-blocking, asynchronous event driven JavaScript runtime
- ◇ Designed to build scalable network applications

# Blocking vs Non-blocking

```
const fs = require('fs');  
const data = fs.readFileSync('/file.md');  
// blocks here until file is read
```

```
const fs = require('fs');  
fs.readFile('/file.md', (err, data) => {  
  if (err) throw err;  
});
```

# Callbacks

- ◇ Asynchronous equivalent for a function
- ◇ A callback function is called at the completion of a given task

```
const fs = require('fs');  
fs.readFile('/file.md', (err, data) => {  
    if (err) throw err;  
});
```

# Modules

- ◇ You can consider them to be the same as JavaScript libraries
- ◇ To include a module, use the **require()** function

# npm

- ◇ Node Package Manager
- ◇ npm Registry is a public collection of open-source packages or libraries
- ◇ Don't reinvent the wheel! Use **npm install** to make use of code others have written!

4

# Hands-on!

Let's build our own server using Express.js!

# Express.js

- ◇ Web application framework for Node
- ◇ Minimal and flexible
- ◇ Great for building Web APIs (Application Programming Interface)

# Initializing your Node.js project

- ◇ Create a new folder on your Desktop
- ◇ Navigate to the folder and open a cmd or terminal window there.
- ◇ Type **npm init** into the cmd or terminal window

# Initializing your Node.js project

```
npm
```

```
PS C:\Users\Martius\Desktop\bot-workshop> npm init  
This utility will walk you through creating a package.json file.  
It only covers the most common items, and tries to guess sensible defaults.
```

```
See `npm help json` for definitive documentation on these fields  
and exactly what they do.
```

```
Use `npm install <pkg> --save` afterwards to install a package and  
save it as a dependency in the package.json file.
```

```
Press ^C at any time to quit.  
package name: (bot-workshop)
```

# Initializing your Node.js project

```
package name: (bot-workshop)
version: (1.0.0)
description: Building my own express server!
entry point: (index.js) app.js
test command:
git repository:
keywords:
author: Martius Lim
license: (ISC)
```

# Initializing your Node.js project

About to write to C:\Users\Martius\Desktop\bot-workshop\package.json:

```
{  
  "name": "bot-workshop",  
  "version": "1.0.0",  
  "description": "Building my own express server!",  
  "main": "app.js",  
  "scripts": {  
    "test": "echo \"Error: no test specified\" && exit 1"  
  },  
  "author": "Martius Lim",  
  "license": "ISC"  
}
```

Is this ok? (yes)

# package.json

- ◇ Tells you important information about your project
- ◇ Tells npm what dependencies your project requires
- ◇ Allows you to specify **scripts** that you can run

# Installing Express

- ◇ `npm install express --save`
- ◇ Note that there are **two dashes**
- ◇ `--save` tells npm to save this module into your `package.json` file as well

# Building a server using Express

- ◇ Open your project in Visual Studio Code
- ◇ Create a file named **app.js**

```
1  const express = require('express');  
2  const app = express();  
3
```

# Building a server using Express

◇ Write the code that starts your server

listening on a port, in this case port 3003

```
7  
8  app.listen(3003, function() {  
9    |   console.log('My express app is listening on port 3003!');  
10  |   });
```

# Building a server using Express

- ◇ Congrats! You've successfully built a server  
using Express on Node.js
- ◇ Now let's make it better 😊

# HTTP Request Methods

- ◇ There are several HTTP Request Methods, namely POST, GET, PUT, DELETE for the Create, Read, Update, Delete functions
- ◇ We will only focus on GET and POST today

# HTTP Request Methods

- ◇ GET requests a representation of the specified resource
- ◇ Requests using GET should only retrieve data

# HTTP Request Methods

- ◇ POST is used to submit an entity to the specified resource
- ◇ Often causes a change in state or side effects on the server

# HTTP Requests in Express

◇ Writing a GET request route handler

```
7  
8   app.get('/', (req, res) => {  
9     |   res.send('Hello World!');  
10  });  
11
```

# HTTP Requests in Express (GET)

- ◇ Pass in parameters using ?
- ◇ localhost:3003?hello=world
- ◇ Accessing GET parameters
- ◇ Use the query property in the request variable
- ◇ E.g. req.query

# HTTP Requests in Express

◇ Writing a POST request route handler

```
17 app.post('/', (req, res) => {  
18   |   res.send('POST request successfully handled!');  
19   });  
20
```

# HTTP Requests in Express (POST)

- ◇ Pass in parameters in the body
- ◇ localhost:3003
- ◇ Accessing POST parameters
- ◇ Use the body property in the request variable
- ◇ E.g. req.body

# nodemon

- ◇ You may find it annoying to keep typing in node app.js whenever you make new changes
- ◇ nodemon is a tool that helps you reload your code automatically upon saving

# nodemon

- ◇ You can install it using **npm install nodemon -g**
- ◇ Now you can run your code using **nodemon app.js** instead of **node app.js**

# nodemon

```
PS C:\Users\Martius\Desktop\bot-workshop> nodemon
[nodemon] 1.11.0
[nodemon] to restart at any time, enter `rs`
[nodemon] watching: *.*
[nodemon] starting `node app.js`
My express app is listening on port 3003!
[nodemon] restarting due to changes...
[nodemon] starting `node app.js`
My express app is listening on port 3003!
```

# Thanks!

## Any questions?
